ID-Guard
by unicloud

Unicloud Identity Protection Service

Cover all IAM Blind spots.

One solution for all your IAM needs that your IDP provider doesn't provide. Compliance, Security and IAM Operations automated.

Cost Savings

Reduce expenses on multiple costly products and long deployment projects.

Co-pilot in collaboration

with your existing investment in threat detection and Identity protection

Flexible to extend to your tailored made use cases.

The Cybersecurity and Infrastructure Security Agency (CISA) released a shocking report on February 23, 2023, revealing the results from a red team assessment they conducted in 2022.

According to CISA, Identity-focused attacks remain the most vulnerable entry point to an organization.

Once an attacker has access, many organizations don't have the tools to alert them that they are inside their environment. The danger here is that an attacker can maintain persistence in the network, gather information, escalate their privileges, and move laterally across the network until they are ready to launch their attack.

This is where establishing identity threat, detection, and response practices can be helpful.

ID-Guard is an innovative approach to closing the gaps between multi-cloud security and multi-cloud Identity management. It addresses the identity protection and management gaps created by the isolated nature of IAM, identity governance and the administration and PAM systems. Thus, ID-Guard complements the solutions of SIEM, EDR, XDR, NDR and other detection tools.

While many SIEM/SOC deployments focused on monitoring IAM activity (e.g., successful, or failed logins, account lockouts, etc.), many other IAM-related events and activities can be logged and monitored to help you alert and automatically respond to malicious activity.

Compliance

Comply with regulatory requirements for the IAM in a click of a button.

Technical Support

With our service, we provide not only pre-configured platform based on our expertise, we will also support you in case of any event detected by our service.

Zero Effort

No need to deploy and maintain multiple products, no need be proficient in every connected resource or IAM security and administration. Let our experts do the heavy lifting for you.

Security

Detect and respond to the identity targeted attacks. Detect misconfigurations, anomalous behaviors, and compromised accounts.

IAM Operations

Reduce TCO and improve user experience. Extend self service capabilities, reduce Helpdesk manual work, and remove unused licenses across SaaS services.

Turnkey Solution

More than 50 different use cases and automated responses, with immediate value and integration with all your security infrastructure.

Service Features and Benefits

The key components of ID-Guard solution include:

1. Real-time monitoring of user accounts and activity
2. Automated threat detection and response through behavior analysis
3. Integration with other security tools, such as firewalls and intrusion detection systems
4. Incident response planning and management

By combining these elements, ID-Guard solution provides organizations with a comprehensive defense against identity-based cyber threats

Out-of-Box Use Cases

Backup logs, policies, and other mission critical data

Track Administrative changes with ability to revert.

Detect security incident such as Session Hijacking and Parallel sessions, Admin impersonation and post-compromise activity by threat actors abusing a stolen session token, Abuse of Push MFA (including "MFA Fatigue" attacks), Credential Stuffing, Password Spray attacks

Monitor and improve your IAM security Posture.

Detect unused application assignments and failed provisioning attempts.

Extend self service to resolve authentication problems (including MFA), application access and missing permissions.

Automated response such as Quarantine a user, confirm device enrollment, and remotely lock device and or terminate open sessions.
